

Mini Game Production Project

Game Title: Black Ninja

→ PART 1: Game Concept & Pre-Production (30%)

– High Concept Statement

Black Ninja is a 2D action platformer where the player controls a fast ninja who runs and jumps, and fights enemies. The core mechanic is precise jumping and sword combat with enemies. The game is made for casual and action game players aged more than 10+.

– Mini Game Design Document (Mini GDD)

Genre: 2D Platformer / Action

Core Mechanics:

- Running
- Jumping
- Wall jumping
- Sword attack

Core Gameplay Loop:

The player enters a level, avoids traps and try to defeats enemies and reaches the exit to win. after that The player moves to the next level.

Level / Environment Ideas:

- Rooftops
- Temples
- Forest stages

Key Assets:

- Ninja character
- Enemies
- Platforms and traps
- Sound effects (jumpin , attack)
- Background music

Art Direction:

2D stylized ninja art with dark colors and simple shapes.

– Pipeline Plan (with Roles)

Pre-Production:

- Game Designer: idea, GDD
- Programmer: prototype
- Artist: concept art

Production:

- Programmer: code the movement of the player and enemies, also combat with bosses and enemies
- Artist: creat characters, levels
- Audio: sound effects

Post-Production:

- QA: testing
- Programmer: fixing bugs
- Producer: release planning

→ PART 2: Rapid Prototyping & Iteration (25%)

– Prototype

Type: Paper Prototype

I drew platforms and a ninja character on paper. I simulated jumping between platforms and avoiding enemies.

– Feedback

Feedback of the peers : The jump is too short to reach higher platforms.

– Iteration Reflection :

I increased the jump height after feedback. This made the movement feel better and smoother. Testing early helped improve the mechanic quickly and avoid a lot of mistakes and problem .

→ PART 3: Team Structure & Collaboration

– Team Roles (Simulated)

- Game Designer: gameplay and levels
- Programmer: movement and systems
- Artist: characters and environments
- Audio Designer: sounds and music
- QA Tester: bug testing
- Producer: task planning

– Workflow Simulation

Tasks are organized from design → development → testing. The designer sends ideas to the programmer and artist. QA reports bugs to the programmer, and the producer checks progress

→ **PART 4: Post-Mortem & Reflection**

– **What went well?**

The prototype helped test gameplay early and peer feedback also helped to know what we should do before releasing the game. Core mechanics were simple and fun.

– **Challenges**

Balancing jump difficulty was hard. Limited of time caused small bugs and some glitch.

– **Most Critical Pipeline Phase**

Pre-production was the most important because it saved time later every hting was perfect .

– **Team Evaluation**

Each role helped improve the game quality also Better communication would reduce mistakes in a real team.

→ **Lessons Learned & Next Steps**

Better testing during production would improve quality. and In the next version I would add stealth mechanics and soome skills to the game and also try to make some lvl hard to make balance between good player and bad player.
